This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma)*, delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, gamaine or cytosine; N = adenine, guanine, cytosine or thymine; samma = thymine; a natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                   Peptides having at least two new nucleotides - useful as primers in RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The invention relates to a novel method of assessing the cardiovascular status in an individual and to newly identified polymorphisms in the genes encoding amplotensin-converting enzyme (ACE), angiotensin II receptor type 1 (ATI) and type 2 (ATI), angiotensinogen (AGI), renin, andotensinogen (AGI), renin, caceptor type 1 (ATI) and type 2 (ATI), angiotensinogen (AGI), renin, caceptor type 1 (ATI) and type 2 (ATI), angiotensinogen (AGI), renin, caceptor type 1 and beta-adensergic andotensinogen (AGI), renin, caceptor type A and beta-adensergic caceptor type A and comparing the setplement at the method comprises determining the sequence at one or more polymorphic positions within these genes, and comparing the predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to cardiovascular disease status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given and prodes for factorising administration of cardiovascular drugs (e.g., ACE inhibitors), beta-adrenergic receptor antagonists (beta and prodes for detecting genetic polymorphic site may be used as privates and probes for detecting genetic polymorphic site may be used as privates and probes for detecting genetic polymorphisms or in molecular chyquents of the genes comprising a polymorphic gates and the proteins comparation of the reading of patients from clinical trials who are predicted to be noncreated with a sub-population of the treatment group betained for use in the appropriate population, partial and error in adverse response, to a particular calmined patient propulation of the treatment group patients are given be approved for use in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thicate link, having endouclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the cestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of cestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are
                                                                                        The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease disgnosis and gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo dT PCR primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids that interact, and optionally cleave, target sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1956
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead trbozyme; bhairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                        Assessing disease status in individual by determining sequence(s) at one or more polymorphic positions within the human genes encoding the protein(s) involved in physiological pathway associated with treatment
                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. The PCR primers shown in sequences AAGGI101-C61371 were all used to demonstrate the methods of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequential consensus region-directed amplification; gene expression; disease diagnosis; gene analysis; human; matrix metalloproteinase; PCR;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid as used to cleave RNA cc C CD20 in the presence of a divalent cation that is preferably Mg^27+.

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, leukaemia, HIV (human immunodeficiency virus) associated NHL, lymphocytic loukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MLL), immunocycoma (IMC), small B-cell lymphocytic lymphoma, immune thrombocytopaenia, and inflammatory arthropathy. The NOGO crasence of a divalent cation that is preferably Mg^2+ Furthermore, the nucleic acid may be contacted with a cell lymphomy and cell may be contacted with a cell act of one or more contacted may be contacted with a cell contact NOGO. The treatment may further compation that is preferably Mg^2+ Furthermore, the nucleic acid may be contacted with a cell contact NOGO-targetting nucleic acid may be contacted with a cell contact a patient having a condition associated with the level of the contact central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke). Alzheimer's disease, muscul

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO). The nucleic acids and the control of a neurite growth inhibitor gene (NGO). The nucleic acids and the control of a nucleic acids (e.g. a ribozyme or a DNazyme) an Inozyme (an andolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a G-cleaver (cleaving RNA with a NCH motif), a G-cleaver (cleaving RNA with a YCY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YCY motif). The CD20-targetting nucleic acid is used to cleave RNA of CC of CD20. The treatment may further comprise the use of one or more corrected with a YCY motification of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-call lymphoma, low-grade or follicular non-cleakaemia, HLV (human immunodeficiency virus) associated WHL, mantle-cell lymphoma (MCL), immunocytoma (MCL), small B-call lymphocytic lymphoma, cleaved with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg^2 t. Furthermore, the creatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the cell and treat a patient having a condition associated with the level of the treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of the treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of therapies. In particular, the NGGO-argetting nucleic acid may be used to treat central nervous system (NS) injury and celebrovaried (CVA, stroke), Alzheimer's disease, dementherapy-induced neuropathy, amyotrophic lateral sclenal energence of states which response to the respect o
                                                                                                                                                                                                                                                                                                                                                                                Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence is an amberzyme molecule of the invention

(AEOM-) AEOMICA INC.

New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.

Disclosure; SEQ ID NO 7878; 214pp; English.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used in gene therapy and vaccine production. The hGDMLP-1 nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunospens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the rapeutic supplement in parients having specific deficiency in hGDMLP-1 capture probes for surface-enhanced having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The concentration and skeletal muscle disorders hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed concentration. The sequence capture patent of the printed concentration and selection in the exemplification of the present invention. N. B. specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequence

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, metanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, conditions alected from cancer, lymphoma, Ewing's sarcoma, metanoma, wypic degeneration, arthritis, psoriasis, verruca ungaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contexting calls of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of

```
Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; Uniq cancer; brain cancer; colorectal cancer; brain cancer; colorectal cancer; pancreatic cancer; lesophageal cancer; atomach cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A·specific inhibitor; chemotherapy; paclitaxel; docetaxel; cisplatin; methortexate; cisplatin; methortexate; gencitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatois arthitis; restenosis; Crohn's disease; obesity; ischaemia; gencitabine; rucimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammatory bowel disease; infection; se.
ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased calls or to detect the presence of ERG RNA in a cell. (I) is useful for specifically targeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and related PCR primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                            0.8%; Score 14.4; DB 1; Length 17; 87.5%; Pred. No. 7.38+02; tive 1; Mismatches 1; Indels

```
regurances expression or a sequence encouring a summing the regular configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regularing REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug theraphes such as monoclonal antibodies, REL-A-specific inhibitors or cyclophosphamide, doxorubin, fluorouracil carboplatin, edarrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as expection, gene therapy applications, ischaemia/reperfusion injury central nervous system (CRS) and myocardial), glomerulonephritis, ceterion, airway inflammation, inflammatory bowel disease, infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The invention describes an enzymatic nucleic acid molecule (I) which down

us10008789-3.rng

```
Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                  invention describes an enzymatic nucleic acid molecule (I) which down
                                                                                                                                                                                                                                                                                                                                                                   regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFKB), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of cother drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gencitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   rheumatoid arthritis, restenosis, asthma, Črohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

NFKB sub-unit modulating inozyme substrate #397.

Enzymatic nucleic acid; nuclear factor kappa B; NFKB; inozyme; zinzyme; G-cleaver; amberzyme; cancer; REL-A activity; breast cancer; human; lung cancer; prostate cancer; colorectal cancer; brain cancer; cosphageal cancer; atomach cancer; bladder cancer; pancreatic cancer; cervical cancer; head and neck cancer; ovarian cancer; melanoma; lymphoma; glioma; multidrug resistant cancer; REL-A-specific inhibitor; chemotherapy; paclitacati, docetaxel; cisplatin; methotraxate; cyclophosphanide; doxorubin; fluorouracil carboplatin; edatrexate; gemcitabine; radiation therapy; inflammatory disease; asthma; diabetes; rheumatoid arthritis; restenoàsi; Crohn's disease; obesity; ischaemia; gene therapy; autoimmune disease; lupus; multiple sclerosis; sepsis; transplant/graft rejection; reperfusion injury; glomerulonephritis; allergic airway inflammation; inflammatory bowel disease; infection; ss. 

```
regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NREB), where (I) is an inosyme, zinzyme, G-cleaver or ambersyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a call, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG 2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophagal, stoomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemeitabine or radiation therapy. The enzymatic and antisense nucleic gemeitabine or radiation therapy. The enzymatic and antisense nucleic caid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes an enzymatic nucleic acid molecule (I) which down
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              infection. This sequence represents the substrate of a novel enzymatic

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HBR2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecules are useful for reducing thematic activity. The nucleic acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HBR2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AlDS. The sequences shown in ABZ59889 - ABZ66216, ABZ66531, ABZ66520 - ABZ66524, ABZ66530 - ABZ66531, ABZ65531, ABZ66531, ABZ66531,
                                                                                                                                                                                                                                                                                                                                        Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is corocted at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 16p12.2 and MD212 is encoded at chromosome 16p12.2 and MD212 is encoded at chromosome 16p12.2 and MD24, MD27, or MD214, MD27, or MD212. And MD214. MD24, MD27, or MD212. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross atterations in MD23, MD24, MD27, or MD212. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as the present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

                                                                                                                                                                                                                                                                                  acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV acid molecules are useful for caducing are also useful for cancer, on HIV acid molecules are shown in ABZ59899 - ABZ62216, ABZ64544 - ABZ65531, ABZ66520 - ABZ65244, ABZ65530 - ABZ65520 - ABZ65524, ABZ65530 - ABZ65520 - ABZ655
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule, that modulates
                                                                                                                                                                                                                                                          The invention relates to a novel short interfering RNA (siRNA) nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  polyallelic gene. The method involves: (a) contracting the unknown allele with a panel of probes, each of which recognises a sequence motif that is present in some alleles of the polyallelic gene but not in others; (b) observing which probes recognise the unknown allele so as to obtain a fingerprint of the unknown allele; and (c) comparing the fingerprint with fingerprints of known alleles. The present sequence represents a specifically claimed probe for use in the method where the polyallelic gene is a human leukocyte antigen class I gene. The method can be used for genes such as mammalian MHC genes, specifically the HLA class I and II genes, the T cell receptor genes in mammals, TAPP, LMP, ras, nonclassical HLA class I genes, human complement factor gene C4 and C2, Bf in the HLA complex, and genes located in mitochondrial DNA, bacterial
expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV. and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ64944 - ABZ65531, ABZ66520 - ABZ65244, ABZ65530 - ABZ65530 - ABZ65534, ABZ65530 - ABZ65534
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A novel method has been developed for identifying an unknown allele of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human leukocyte antigen; HLA; probe; tissue transplantation; MHC gene; major histocompatibility complex; paternity test; forensic medicine; haematological malignancy; inherited disorder; adoptive immunotherapy;

```
nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences AA265197-265440 represent novel phosphorothioate antisense oligonucleotides targetted against the human CD71 gene, which encodes the CD71 transferrin receptor. Upon uptake in the small intestine, iron immediately combines with the ubiquitous serum protein transferrin, the primary vehicle by which iron is transported around the body. The uptake of circulating iron-transferrin complexes is mediated by the transferrin receptor, CD71. The requirement of both iron-transferrin complexes and CD71 for cell proliferation suggests that inhibition of iron utilisation could represent a strategy for the treatment of cancer. The could represent a strategy for the treatment of an animal suspected of having a disease or disorder which can be treated by inhibition of CD71 expression. Use of the antisense compounds and methods of the invention may also be useful prophylactically to prevent or delay infection, inflammation or tumour formation. The antisense compounds may also be useful for research and as diagnostic tools. The antisense oligonucleotides provide a tool for effectively downregulating CD71 expression. Prior art methods utilised antibodies specific for CD71 proteins; however, this resulted in the development of resistant tumour
                                                                                                                                                                                                                                                                                                                                                                              ö
                   the alleles of the HLA genes in a prospective donor and a prospective recipient in tissue or organ transplantations. The method can also be used in paternity testing, in forensic medicine, as a follow up technique in treatment of haematological malignancies or inherited disorders, in adoptive immunotherapy, and in identification of bacteria and viruses. The method can provide for the identification of alleles of the polyallelic genes using a limited number of selected recurring motif
method is particularly useful for matching
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense oligonucleotides targeted to genes encoding CD71, useful for preventing, diagnosing and treating inflammatory disorders and tumors.
                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human CD71 phosphorothioate antisense oligonucleotide SEQ ID NO:71.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; CD71; transferrin receptor; antisense; phosphorothioate;

                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose usceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, echizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

Sequences AAH17205 - AAH40944 represent PCR primers, single nucleotide polymorphisms SNPs. The present invention false is single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more SNPs. Phenotypic trait suspected of being caused by one or more and acute intermittent pophyria. Phenotypic traits also include symptomes of or susceptically to multifactorial cisease of which a component is or may be genetic such as autoimmune disease of which a component is or may be genetic such as autoimmune microorganism. The method is also useful in forensic investigations and microorganism. The method is also useful in forensic investigations and patenting and patentity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Novel antisense compound useful for treating diseases associated with Cyclin D2 expression, comprises an oligonucleotide comprising up to 50 nucleobases in length, which inhibits expression of Cyclin D2 in cells or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a compound (I) of up to 50 nucleobases in length, which inhibits the expression of Cyclin D2. (I) is useful for inhibiting the expression of Cyclin D2 in cells or tissues in vitro. (I) is thus useful for treating disease associated with Cyclin D2 expression. (I) is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This sequence represents human cyclin D2 inhibition
                                                         Antisense inhibition of human cyclin D2 related oligonucleotide #48.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Downstream PCR primer recognising the 5'' region of betal-AR DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0.8%; Score 14.4; DB 1; Length 18; 93.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to antisense compounds targetted to a nucleic acid molecule encoding Her2 (human Epidermal Growth Factor receptor 2) that specifically hybridises with and inhibits the expression of Her2. Antisense compounds of the invention are used for treating diseases or conditions associated with Her2 such as hyperproliferative diseases or lung, breast, gastric, oesophageal, colon, bladder, salivary, neural or cardiac cancer. They are also useful prophylactically e.g. to prevent or delay infection, inflammation and tumour formation. The invention is also used in gene therapy. The present sequence is an antisense oligonucleotide targetted to human Her-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antisense oligonucleotide which modulates the expression of Human Epidermal Growth Factor receptor, Her2, is useful for treating tumors inflammation or to prevent infection in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                           PCR primers AAV65954-57 were used to screen for the transgene of the invention. The upstream primers recognise the alpha-myosin heavy chain promoter (alpha-MfC) and the downstream primers recognise 5' region of the human betal-adrenergic receptor (betal-AR) coding region. The specification describes a transgenic animal, especially a mouse, which has incorporated into its genome a transgene comprising a heart tissuebecific promoter operatively linked to a coding sequence comprising betal-IAR, the transgenic animal. The transgenic animal can be used as a model for heart muscle disease and heart failure in a mammal. The transgene can also be used for treating heart failure in a mammal. The

The invention relates to the human ABCI cholesterol transporter protein

(B18082) and to nucleic acid sequences (G5120) which encode it. ABCI is
a member of the ATP-binding casettee (G5120) which encode it. ABCI is
a member of the ATP-binding casettee (G5120) which encode it. ABCI is
a member of the ATP-binding casettee (ABC transport. particularly
concerns, and plays a crucial role in cholesterol transport, particularly
cinvolved in cholesterol efflux from the cell. The gene encoding ABCI is
involved in cholesterol efflux from the cell. The gene encoding ABCI is
conversed on chromosome 931, and mutations in this gene are associated
with two genetic HDL (high density lipoprocein) deficiency disorders.

CC carditogushable in that TD is an autosomal recessive disorder. While
CFHA is inherited as an autosomal dominant trait. Low levels of HDL ("good
corelate as an autosomal dominant trait. Low levels of HDL ("good
corelate as an autosomal dominant trait. Low levels of HDL ("good
corelate as an autosomal dominant trait. Low levels of HDL ("good
corelates, particularly coronary artery disease.

CC cholesterol") in the blood correlate with a high risk of cardiovascular
disease, coronary restenosis, and peripheral vascular disease.

CC conversely, a high level of HDL has protective effects against
cardiovascular disease. The invention provides genetic constructs and
cardiovascular disease comprising the administration of an expression
cardiovascular disease comprising the administration of an expression
cc cardiovascular disease comprising the administration of an expression
cc cardiovascular disease, coronary restenosis or peripheral vascular
cuther relates for cardiovascular disease, especially coronary artery disease,
crebrovascular disease, coronary restenosis or peripheral vascular
crebrovascular disease, Alinked de
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                        New ABC1 polypeptide is useful for treating diseases associated with ABC1
biological activity, e.g. Alzheimer's disease, Huntington's disease and

Such sc-PBMs can associated antigon (HLAA) and for preventing or treating cancer in a patient in which the cancer features HLA-expressing tumour cells (claimed). Targets include tumour cells or virally infected cells. The sc-PBM can be used to selectively control T-cell mediated immune responses such as T-cell proliferation, differentiation, activation or B lymphocyte stimulation. This can be used to reduce or eliminate an immune response
                                                                                                                                                                                                                                             treating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ij
                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDK1, PCNA and Cyclin B1.
Representative examples of ribozyme recognition sites are given in AAARASIS to AAA6787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                        New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDK1, PCNA and Cyclin B1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Treating proliferative skin or eye diseases and scarring, using ribc that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                            The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme (1) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloprotainse (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid melecule (II) comprising a promoter operably linked to a nucleic acid segment encoding (I). (I) can have antipsoriatic, copthalmological, cytostatic, antiseborrheic, antidiabetic, antisickling, copthalmological, vunearary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, aguamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing scarring such as keloid, adhesion and hypertrophic or hypertrophic burn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides, useful for detecting bacteria that may contaminate drinking water, provide quick results for many species in parallel.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detection, probe, contaminant, drinking water, Legionella, coliform; faecal streptococci, soil; sputum, biopsy, urine, food, pharmaceutical, cosmetic, fluorescent in situ hybridisation, FISH, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide probes used to detect contaminant bacteria that may be present in drinking water. The probes

are 5-methylcytidines"
can detect bacteria (especially Legionella, faecal streptococci and coliforms) that may contaminate drinking water in environmental samples (water or soil), clinical samples (sputum, biopsies, urine etc.), in bathing and drinking water and in foods, pharmaceuticals and commetics, in by in situ hybridisation. The probes combine the advantages of fluorescent in situ hybridisation with those of culture methods only a relatively short culture step is required; analysis takes 24-48 hours (contrast many days for conventional methods) and all relevant bacteria ean be tested simultaneously. The oligonucleotides can differentiate between species of the same genus and are easy to use, allowing simple analysis of a large number of samples. ABX94532-ABX94578 represent the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; antisense; thyroid hormone receptor interactor 6; TRIP6; tumour; OPA-interacting protein-1; OIP-1; zyxin-related protein-1; prophylaxis; inflammation; therapy; hyperproliferative disorder; infection; cancer; chromosome 7q22; ZRP-1; phosphorothioate; ss.

                                                              The invention relates to antisense compounds targetted to a nucleic acid encoding thyroid hormone receptor interactor 6 (TRIP6) to inhibit its expression. TRIP6 is also known as OPA-interacting protein-1 (OIP-1) and zyxin-related protein-1 (ZRP-1). TRIP6 DNA is located on chromosome 7q22. Antisense compounds of the invention are useful for modulating the expression of TRIP6 such as hyperproliferative disorders (e.g. with the expression of TRIP6 such as hyperproliferative disorders (e.g. cancer). They are useful for diagnostics, therapeutics, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation, as research reagents and kits and in distinguishing between functions of various members of a biological pathway. The are also useful in antisense therapy. The present sequence is an antisense oligo targetted to human TRIP6 DNA. This oligo is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Dimethylarginine dimethylaminohydrolase; DDAH; DDAH1; DDAH2; arginine deaminase; hyperlipidemia; renal failure; hypertension; restenosis; atherosclerosis; schizophrenia; multiple sclerosis; cancer; ischemia repertusion injury; septic shock; multi organ failure; arthritis; skin disorders; inflammatory cardiac disease; migraine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequential consensus region-directed amplification for sorting mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease disgnosis and gene expression patterns in 2 samples e.g. For primer used to illustrate the method of the invention
             cancer. Modulators of the enzyme can be used in medicaments for the treatment of ischemia-reperfusion injury of the brain or heart, cancer, lethal hypertension in severe inflammatory conditions such as septic shock or multi-organ failure, or local and systemic inflammatory disorders including arthritis, skin disorders, inflammatory cardiac disease, migrafine, or microbial or bacterial infection. The sequence of human DDAH was obtained by data base searching. The EST's used in the process are given in GENESEQ records AAA47661-A47677
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequential consensus region-directed amplification; gene expression;

The present sequence represents a PCR primer which is used in an example from the present invention for the isolation of human TSA7005 gene. The human TSA7005 protein shares 32% homology with human and mouse Reg proteins, and 34% homology with the rat Reg protein. TSA7005 mas pancreatic beta cell growth activity and hypoglycaemic activity. The TSA7005 protein can be used for the diagnosis and treatment of diseases associated with the gene and its expression product
                                                                                                                                                                                                                        TSA7005 gene, encoding a polypeptide useful for the diagnosis and treatment of diseases associated with its expression.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta -N3'; or (X)m5'-(alpha)a-beta a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine, crytosine; N = adenine, guanine, cytosine or thymine; gamma = thymin; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of repetition of gamma, in which thymine expressed by gamma is composed of 13 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides having at least two new nucleotides - useful as primers in RT-

This invention relates to the human LUNX protein and the polynucleotide sequence encoding it. The invention includes a vector containing a LUNX golynucleotide, a host cell transformed with the vector, and an antibody that binds to LUNX. The gene can be used for cancer diagnosis and diagnosis of micrometastatic cancer and for the production of the LUNX
                                                                                                                                                                                                                                                                                                                                   Polynucleotide encoding LUNX gene product useful for the detection of cancer especially micrometastatic cancer.

The sequence is that of a bovine microsatellite sequence obtd. by
screening a genomic library of bovine MboI DNA fragments of between 250
and 500 bp with an (ACI)5 and a (TCI)5 oligomuclectice probe. One out of
50 clones cross-hybridised. Assuming independent distribution of
microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites
in the bovine genome is estimated at >100, 000. The sequence information
for ca. 230 such bovine microsatellites is summarised in the
specification and indexed herein (see below). The sequences upstream and
commiscream of the microsatellite sequence were used to generate the
required PCR primers for in vitro amplification of the corresp.
microsatellite (using the program OPTTRRIM). The microsatellites may be
used to identify individuals, for parentage testing, and in the genetic
mapping of economic trait loci, or genes involved the determinism of
economically important traits esp. in cattle, to allow selective
breeding. See also AAQ33501-34437. (Updated on 25-MAR-2003 to correct PN

DUBS enzymes are ubiquitin-specific thiol proteases or Deubiquitinating forms.

(DUB) enzymes. The DUB enzymes are induced by at least one cytokine and include two conserved domains (CYS and HIS domains). DUB-1 is interleukin (LI)-3, IL-5 and/or GM-CSF induceble and is expressed in haematopoietic cells and induces growth arrest of the cell in the GO/GI phase of the cell cycle. The enzymes of the invention can be used to arrest preventing e.g. cancer especially leukaemias or lymphomas. The enzymes an also be used to arrest preventing e.g. cancer especially leukaemias or lymphomas. The enzymes can also be used to stimulate preferably haematopoietic cell proliferation e.g. to produce blood cells for replacing blood cell depletion due to disease or condition e.g. immune suppression from AIDS or therapy such as chemotherapy or dialysis. The enzymes may also be used to suppress the immune system e.g. during organ or cell transplantation. The nucleic acid can be used to transform cells for screening agents

PolyT oligonucleotides (see AAV12217-28) were used in reverse transcription reactions on polyA+ RNA isolated from the fins of control or retinoic acid-treated zebrafish (Danio rerio). Several combinations of AAV12229-33) for differential display PCR. Bands demonstrating reproducible differential amplifications were found using the primers given in AAV12221 and AAV12231. The PCR product was reamplified (see AAV1224-35). A differential display product (see AAV12213) which exhibited a dependence on the presence of retinoic acid for its exhibited a dependence on the was used to isolate a full-length clone (see AAV1223) coding for a novel retinoid metabolising protein (see AAV1223), designated zP450RAI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This is a 3' poly(T) PCR primer used in the amplification of the inducible cytochrome P450RAI gene which specifically metabolises a derivative of the retinoic acid (RA). The cytochrome P450 gene in general produces enzymes involved in the oxidative metabolism of endogenous and exogenous compounds. The cytochrome P450 nucleotide sequence can be used to induce or suppress the expression of its protein. P450RAI is highly induced by RA in cell lines and tissues. This allows for the development of a drug screen using promoters and nucleotide sequences to identify drugs which are useful for reducing the catabolism of RA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Retinoid metabolising protein; P450RAI; retinoid oxidase; retinoic acid; zebrafish; inhibitor; antisense; cancer; actinic keratosis; oral leukoplakia; head tumour; neck tumour; non-small call lung carcinoma; asal cell carcinoma; acute promyelocytic leukaemia; skin cancer; acne; psoriasis; ichthyosis; therapy; diagnosis; screening; differential display; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying DNA encoding inducible or suppressible cytochrome P450 - by screening for drugs which reduce the catabolism of retinoic acid, useful in cancer chemotherapy and the treatment of acne and psoriasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

RESULT 1216

ઠે 셤 DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triple-x formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA genes for ribosomal RNA) in clinical samples, but also detecting oncogenes and Hepatitis B virus

sequences to an aqueous medium containing at least one

```
AAX02695-X02708 are primers used in the isolation of a novel barley (Hordeum vulgare) hydroxyphenylpyruvate dioxygenase (HPPD) protein. This protein is useful for plant transformation to produce transgenic plants especially where an expression cassette is introduced into a plant cell. callus tissue, a whole plant or protoplasts by Agrobacterium tumefaciens transformation, electroporation or particle bombardment and where the plants are selected from soya, barley, wheat, oilseed rape, maize and sunflower, or where the DNA is expressed in tobacco plants, especially in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Triplex formation; DNA detection; triple helix; identification; bacteria;
                                                                                       DNA encoding barley hydroxyphenylpyruvate dioxygenase - for producing plants with increased vitamin E content, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is sequence. Triplex formation results in displacement of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify

Query Match

The present sequence represents a polymucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the invention, where it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded DNA test

Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify

                                                                                                                                                                                                                                                                                                                                                                  Optical detection of hybridization complexes for specific target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                        target nucleic acid presence in a sample. A preferred target is a Mycobacterium complex nucleic acid sequence. The detection method uses visual detection of a change in the hybridization without aid of instrumentation. Multiple copies of a target nucleic acid sequence are mixed with first and second detectable probes under hybridizing conditions favouring particle agglutination via a bridging molecule allowing for visual detection of the target nucleic acid sequence. The bridging molecule enhances or inhibits formation of a hybridization

The present invention describes human senescence factor p23. An expression vector for p23 is useful for inducing a senescent phenotype in expression vector for p23 is useful for inducing a senescent phenotype in a cell (preferably eukaryotic). This may help in regulating diseases, including cancer, persistent inflammation, and various proliferative and degenerative disorders. These transgenic cells are useful in gene therapy of for treating cancer, particularly where antisense oligonucleotides are useful for blocking normal or mutant p23 expression in cancer cells or other proliferating cells. Transgenic cells are also useful for producing the p23 polypeptide in large quantities. The antibodies are useful for culture and tissue biopsies. The p23 polymocleotides are useful for modulating the whole gene encoding p23, and variants of p23. Assays based on p23 elements, which detect p23 levels and activity are useful as clasolating the whole gene encoding p23, and variants of p23. Assays based on p23 elements, which detect p23 levels and activity are useful as clasolating the whole gene encoding p23, and activity are useful as clasolating the whole gene encoding p23, and variants of p23. Assays based con p23 elements for staging tumours, determining prognosis, and/or predicting therapeutic success. These elements also provide an assay for detecting chromosomal rearrangements in chromosome 3 in a human cell. The solution of the p23 polymucleotide permits the manipulation of malignant growth in cancer. The present sequence represents a primer used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide #1 containing 3'-C-amino-5'(S)-C,3'-N-ethanothymidine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Newly isolated nucleic acid molecule (designated p23) encoding a p2
polypeptide – useful for inducing a senescence phenotype in a cell.
Human, senescence factor; p23; cancer; persistent inflammation; proliferative disorder; degenerative disorder; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Conformationally-locked oligonucleotide, antisense inhibitor;
bicyclic sugar nucleoside analogue; gene probe; ds.

```
The present sequence is an oligonucleotide containing 3'-C-amino-5'(S)-C'3'-N-ethanothymidine, a bicyclic-sugar nucleoside. All nucleotides in the sequence were incorporated by phosphoramidite chemistry using a DNA synthesiser. Bicyclic sugar nucleosides are conformationally restricted 3',5'-bridged nucleosides which can be used as building blocks for oligonucleotides. Oligonucleotides can be produced that have certain, desired, geometrical shapes and entropy advantages. They may have superior hybridisation to DNA and RNA, and excellent biological as antisense inhibitors of gene expression or as gene probes, and may therefore be used in antisense therapeutics or gene-specific diagnostics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New conformationally restricted 3',5'-bridged nucleosides and oligonucleotides useful as antisense therapeutics or as gene-specific
                                                                                                                                                                                                                                                                                                                                                       /*tag= g

The melting temperature of a double-strand formed by the light-responsive oligonucleotide, and another oligonucleotide complementary to the light-responsive oligonucleotide, reversibly changes depending on light irradiation. The oligonucleotides are useful in biotechnology, e.g. in controlling DNA elongation, gene expression, amplification and transcription, and for efficient gene diagnosis and gene therapy. The

                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                Oligomers comprising L-ribo-Locked Nucleic Acid (LNA) nucleosides, useful for therapeutic purposes e.g. in the construction of oligonucleotides, as substrates for nucleic acids polymerases and in RNA mediated catalytic
                                                                                                                                                                                                The present invention relates to an oligomer comprising L-ribo-configurated Locked Nucleoside Analogues (L-ribo-LNA analogues). The present sequence is an RNA oligomucleotide. Binding studies of the L-ribo-LNA analogues towards the present sequence were carried out, to determine the thermostability of the L-ribo-LNA analogues. The analogs of the present invention have a variety of uses e.g. in the preparation of conjugates of the L-ribo-LNA modified oligomucleotides (oligomers)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression

                                                                                                                             The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA fragment ligated material; (d) amplification of the linker X-CDNA tagines and attrial; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the clarification of difference in function or morphology of cells under beysiological or pathological conditions. The cDNA or cells for assay can be especifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-cDNA fragment ligated meterial; (d) amplification of the linker X-cDNA tag-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape
analysis, disease diagnosis and identifying target for gene therapy

```

example from the present invention

```
linker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the clarification of difference in function or morphology of cells under physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Construction of cDNA tags for identifying expressed genes with specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  identifying an expressed gene. The method comprises: (a) preparation of complementary deoxyribonucleic acid; (b) producing CDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA fragment ligated material; (d) amplification of the linker X-CDNA tag—linker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the physicalogical or pathological conditions. The CDNA or cells for assay can be specifically expressed with reproducibility and accuracy in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Construction of cDNA tags for identifying expressed genes with specific linkers and recognition sequences, applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy.
                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                              ö

The present invention describes a method for constructing a cDNA tag for identifying an expressed gene. The method comprises: (a) preparation of complementary decoxyribonucleic acid; (b) producing cDNA fragment by cleavage with II type restriction enzyme; (c) obtaining a linker X-CDNA fragment Ligated material; (d) amplification of the linker X-CDNA taglinker Y ligated material; and (e) cleaving the amplification product. The method can be used for the construction of cDNA tags for identifying expressed genes, which is applicable in gene expression analysis, disease diagnosis and identifying target for gene therapy, including the physiological or pathological conditions. The cDNA or cells for assay can be specifically expressed, with reproducibility and accuracy in the detection of genes. The present sequence represents an expressed gene identification (EGI) cDNA tag related oligonucleotide which is used in an

```
Detecting single nucleotide polymorphism for expressing sensitivity information of diseases and drugs, comprises using a new oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method for detecting single nucleotide polymorphisms (SNPs). Also described is an oligonucleotide used in the detection of an SNP, prepared by binding an oligonucleotide having a complementary sequence or those devoid of up to several bases with 1 or more organic group(s) to be tested by light irradiation of a specific wave length to vary a double strand formation property of the oligonucleotide to be tested. The method is used for detecting SNPs. The present sequence represents a light responsive oligonucleotide which is used in an example from the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New DNA fragments having promoter activity, useful in retinoid metabolism, as well as in producing retinoic acid metabolizing cytochrome P450s that are useful as targets for the treatment of certain cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to retinoid (e.g., retinoic acid (RA), vitamin A) metabolising proteins and nucleic acid sequences encoding them. RA metabolising proteins contain a hasme-blinding motif which is characteristic of the group of proteins known as cytochrome P450s. The sequences of the invention are useful in retinoid metabolism and in particularly useful as targets for the treatment of certain cancers such as prostate cancer. The invention also relates to a method of screening drugs for their effect on activity of RA inducible proteins. The present DNA sequence is poly(T) PCR primer which is used for isolating retinoid regulating genes by differential display of mRNAs
                                                                                                                                                                                                                                                                                                                                                                                                                         Retinoid metabolism; retinoic acid; RA; haeme-binding motif; vitamin A; cytochrome P450; prostate cancer; drug screening; PCR primer; retinoid-regulated gene; ss.

Mouse relA hammerhead ribozyme target sequence (nt. position 129)

(first entry) (revised)

25-MAR-2003 07-APR-1997

AAT54816;

```
The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                              b DT, Chowrira B, Direnzo A, Draper KG, Dudycz LW;

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nucleotide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Thompson JD;

mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit rela expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme that cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acid; ribozyme; trans cleavage; inhibition; gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; attoke; restenosis; transplant rejection; rheumatoin attoke; restenosis; transplant rejection; rheumatoin atthitis; psoriasis; myocardial infarction; attoke; testenosis; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents a preferred target sequence for an enzymatic nuclecide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid archritis, asthma and other inflammatory disorders. Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

Claim 2; Page 172; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rheumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves ICAM-1 mRNA at the nucleotide base position indicated in the DE line. Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(gamma) K-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; v = adennine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
designed and synthesised with modifications that improve their nuclease resistance. The ribozymes cleave the ICAM-1 target sequences and thereby inhibit ICAM-1 expression, making them useful for reducing transplant rejection and alleviating symptoms in patients with rhumatoid arthritis, asthma and other inflammatory disorders. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                       RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

                                                                                                                                                                               The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the treatment of gastric rellux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori
Treating gastric acid disturbance by administering an oligonucleotide which modulates the activity of a polypeptide involved in gastric acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotide of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic brain or skin, growth factor-mediated malignancies, other sclerotic Example 8; Page 60; 201pp; English. vessels or any other hyperplasia

A triple-helix comprising a double helical nucleic acid (DHNA) and an olisonuclectide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression.

Example 6; Fig 20A; 108pp; English

The present invention relates to methods and oligonucleotides for forming a triple-helix comprising a double helical nucleic acid comprising first and second substantially complementary strands, and an oligonucleotide bound to a putine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or orientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeut. applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specific and therapeutic purposes. The oligonucleotides can be selected to specific and therapeutic purposes. The oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogenic of triple-helix cupin confidence and be used in cancer treatment by way of triple-helix suppression of specific oncogenes including those of endogenous or viral conjun. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancer treatment by way of triple-helix conjun. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancer treatment by way of triple-helix conjuncated the present sequences and concerned and concerned consing concerns an oligonucleotide used in the methods of the present invention

Triple helix forming associated oligonucleotide #50. ABK98186 standard; DNA; 15 07-OCT-2002 (first entry) ABK98186; RESULT 1243 

Triple-helix formation; purine-rich target sequence; double-helix DNA; gene expression; regulatory sequence; pathogenic double-stranded DNA; pathogenic bacteria; virus; replication; virulence; cancer; cancer; oncogene suppression; cancerous cell; cytostatic; antimicrobial; ss.

Synthetic

artiple-helix computation tenance to mertions and objects to the comprising a double helical nucleic and second substantially complementary strands, and an oligonucleotide bound to a purine-rich target sequence within the double helical nucleic acid, where the oligonucleotide binds in a parallel and antiparallel or crientation, respectively, to target sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including selected to specifically bind to pathogenic double-stranded DNA including selected to specific sequence required by pathogenic bacteria or viruses for replication or virulence, reducing their pathogenicity. Alternatively, the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The presence can be used in cancer treatment by way of triple-helices with such sequences including those of endogenous or viral origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancer causing the cancer causing one of a preferentially killing or repressing the cancer causing calls. The presents equence represents an oligonucleotide used in the The present invention relates to methods and oligonucleotides for forming A triple-helix comprising a double helical nucleic acid (DHNA) and an olisonuclectide which binds in parallel and antiparallel orientation, respectively, for targetting sequences on alternate strands of DHNA to control gene expression. ```
repeat within a coding sequence (expressed sequence tag, PST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotomic dystrophy, hyperandrogensemia, spinal and bulbar atrophy and expinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS

The invention relates to sequences of at least two nucleotides of formula: (X)m5'-(alpha)n-beta-N3'; or (X)m5'-(agamma) k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or vytosine; N = adenine, guanine or thymine; the nucleotides at thymine; k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of the sess of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula: (X)mS^{-}(alpha)n^{-}beta-N3; or (X)mS^{-}(gamma) K-delta-N3; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or N; V = adenine, guanine or cytosine; N = adenine, guanine, cytosine or thymine; N = adenine, N = 
                                                                                                                 RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Peptides having at least two new nucleotides - useful as primers in RT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                              Peptides having at least two new nucleotides - useful as primers in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

mouse-human chimeric antibody, useful for in vivo diagnosis of cancer

Example; Col 37; 120pp; English

variable region exons and heavy chain variable region exons of antibodies coty and coss. The Cantibodies are directed against TAG-72, and are produced from the rearrangement of WhalpharRG (AAZ4701). The antibodies are used in the invention which relates to a new anti-tumour associated sialylated glycoprotein antigen (TAG)-72 mouse-human chimeric antibody. The variable region of the antibody has a heavy chain (VH) where VH is choosed by a DNA sequence homologous to the VHalpharAG germline gene. The invention includes a method for in vivo carcinoma targeting through the administration to an animal of an anti-TAG-72 mouse-human chimeric antibody produced by specific cell lines. The antibody or a fragment are conjugated to an imaging marker or therapeutic agent, in a pharmaceutically acceptable, nontoxic, sterile carrier. The chimeric antibody binds to TAG-72 which is found on certain human tumour cells. The tissue regions containing the tumours can be detected via the markers and/or can be treated via the therapeutic agents. The method is useful for in vivo diagnosis and treatment of cancer by administering to an AAZ40722-Z40734 are primers used in the sequencing of the light chain

monoclonal antibodies directed against TAG-72, designated colon cancer (CC) antibodies. The CC antibodies are produced from the rearrangement of VHalphaTAG (AAZ40701). The antibodies are used in the invention which relates to a new anti-tumour associated sialylated glycoprotein antigen (TAG)-72 mouse-human chimeric antibody. The variable region of the antibody has a heavy chain (YM) where VM is encoded by a DNA sequence homologous to the VHalphaTAG germline gene. The invention includes a method for in vivo carcinoma targeting through the administration to an animal an of anti-TAG-72 mouse-human chimeric antibody produced by specific cell lines. The antibody or a fragment are conjugated to an imaging marker or therapeutic agent, in a pharmaceutically acceptable, nontoxic, sterile carrier. The chimeric antibody binds to TAG-72 which is found on certain human tumour cells. The tissue regions containing the tumours can be detected via the markers and/or can be treated via the therapeutic agents. The method is useful for in vivo diagnosis and AAZ40715-Z40718 are primers used to sequence the heavy chains of

amplification for sorting a mixture of DNAB into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAB into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo dT PCR primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of sequential consensus region-directed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequential consensus region-directed amplification for sorting mixture of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequential consensus region-directed amplification; gene expression; disease diagnosis; gene analysis; human; matrix metalloproteinase; PCR; primer; 88.
                                                                                                                                                                                                                                                                                                                                               Sequential consensus region-directed amplification for sorting mixture DNAs into 2 or more subsets or distinguishing gene expression patterns 2 samples, useful for disease diagnosis and gene analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligo-dT PCR primer #7 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is a sequencing primer for nucleic acids encoding Mouse antibody heavy chains CC83VH, which can form chimaeric antibody molecules of the invention. The invention concerns chimaeric antibody heavy chains or their chimaeric antigen-binding fragment which have the ability to combine with anti-TAG-72 antibody light chain to form a binding site having an affinity for TAG-72 which is at least 25% greater than that of B72.3 (an antibody known to the prior art). TAG-72 is a human tumour antigen thought to be a mucin glycoprotein. DNA sequences encoding the chimaeric heavy chains are useful for producing antibodies that are useful for ancer treatment, such as in vivo diagnostic assays, in vivo therapy and radioimmunoguided surgery. The antibodies produce significantly fewer side-effects when administered to human patients
                                                                                                 Mouse; antibody; CC83VH; TAG-72; mucin; chimaeric heavy chain; B72.3; tumour; cancer; radioimmunoguided surgery; sequencing primer; ss; JH2(-).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel DNA sequence encoding chimeric antibody heavy chain or its chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequential consensus region-directed amplification; gene expression; disease diagnosis; gene analysis; human; matrix metalloproteinase; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antigen-binding fragment, useful for cancer treatment, such as in vivo diagnostic assays, in vivo therapy and radioimmunoguided surgery.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oligo-dT PCR primer #5 used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis.
                                                        The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene expression patterns in 2 samples e.g. For primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of sequential consensus region-directed amplification for sotting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease disgnosis and gene expression patterns in 2 samples e.g. For primer used to illustrate the method of the invention
DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples, useful for disease diagnosis and gene analysis.
                                                                                                                                                                                                                                                                                                                                                                                                               Sequential consensus region-directed amplification; gene expression; disease diagnosis; gene analysis; human; matrix metalloproteinase; PCR;
                                                                                                                                                                                                                                                                                                                                                                                          Oligo-dT PCR primer #9 used to illustrate the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AXX6725 to AXX6752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present invention describes nucleic acid molecules which modulate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                             Human flt1 VEGF receptor hammerhead ribozyme substrate #1093

A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fl.1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                 Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDSF, hammerhead ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention describes nucleic acid molecules which modulate the

The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro (di)thioate link, having endonuclease activity. (A), and more generally are catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves to sesistance to nucleases, binding affinity and/or activity. AAA23533 to AAA2474 tepresent oestrogen receptor hammerhead ribozyme sequences.

AAA24748 to AAA25392 represent their corresponding target sequences. AAA26107 to AAAA2618 represent their corresponding target sequences. Sequences. AAAA26107 to AAAA26218 represent their corresponding target sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acids that interact, and optionally cleave, target sequences,

Jarvis T,

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphom, Bwing's sarcoms, melanoma, conditions selected from cancer, lymphom, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, anthritis, psoriasis, verruca vulgaris, angiofibroma of tumborous sclerosis, port-wine stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing (I) is useful for treating a patient having a condition associated with he level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more theraples under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or conjunction with one or more of other theraples such as radiation or cell, by contacting (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic cool to the presence of ERG RNA in a cell. (I) is useful for specifically contacting genes that share homology with ERG spens or ERG fusion genes. ABRI3334-ABRI2719 represent nucleic acide, including antisense and carged procession of the invention catide, including antisense and carged procession catide, including antisense and catated PCR primers of the invention ö Gaps ö 8%; Score 14; DB 1; Length 17; 0.0%; Pred. The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acide (SI, Masha9399). a sequence having 6\$\$ sequence identity to (S1), (S1), having 9\$\$ deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPases as well as downstream components of the signal transduction pathway. (I) is useful correction a sequence of the signal transduction pathway. (I) is useful correcting a specific binding partner. (I) and nucleic acids (II) caused by altered expression of human POSHL1 including disease and treating cancer, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating transgenic non-human animals capable of producing the proteins. The present sequence is that of a scanning oligonucleotide useful in examples continued specification. But is based on sequence information supplied to printed specification, but is based on sequence information supplied to Derwent by the European Patent Office

```
The invention relates to an isolated SH3 domain (POSH)-like signalling protein 1 (POSHL 1) polypeptide (I), comprising a sequence of 730 amino acids (St, ABBR3999), a sequence having 65% sequence of 6511, (S1), having 95% deviations, especially conservative substitutions or a fragment of the sequences comprising at least 8 contiguous amino acids. Human POSHL 1 is a proto-oncogene/oncogene product that functions as an adaptor protein that interacts with Rho family small GTPsases as well as downstream components of the signal transduction pathway. (I) is useful as concoling (I) are useful for diagnosing, monitoring disease and treating cansed by altered expression of human POSHL1 including diagnosing and conserv, they useful in the development of vaccines and (II) is useful in gene therapy. (II) is useful for constructing microarrays which are useful for measuring and for surveying gene expression and creating care useful for measuring and for surveying gene expression and creating created sequence is that of a scanning oligonucleotide useful in examples of the invention. The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ12, MDZ12 is concoded at chromosome 7422.1, MDZ4 is encoded at chromosome 7422.1, MDZ4 is encoded at chromosome 6521.3-22.2, MDZ7 is encoded at chromosome 6521.3-22.2, MDZ7 is encoded at chromosome 1621.2 and MDZ12 is encoded at chromosome second in the and in manufacturing a medicament for treating or preventing a disorder or increased expression or activity of MDZ3, MDZ4, MDZ1, or MDZ12, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for disgnosing or monitoring a disease acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as

```
ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are quantifying and/or amplifying nectecting, identifying of a gene chip, in vitro as (anti)sense reagents; and (2) for production of a gene chip, in vitro as (anti)sense reagents; and (2) for production of a recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

ACC6886), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in viro as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration.
                                                                                                                                                                    New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistence. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip, in virto as (anti) sense reagents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, consense and antisense sequences, of nucleotides involved in tumour sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). cytostatic, antiviral, neuroprotective, nootropic, neuroleptic, ss; primer; probe; tumour suppression; tumour reversion; apoptosis; virus resistance; transgenic animals; Alzheimer's disease; schizophrenia; cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies. The invention describes an isolated or recombinant polypeptide (I)

comprising a sequence: (a) comprising 1 of 30 sequences (S1), as given in

the specification, or a conservative variant; (b) encoded by 1 of 30,

sequences (S2), as given in the specification, or a conservative variant;

(c) encoded by a sequence that hybridises under stringent conditions to

S2; and (d) encoded by a sequence 70 % identical to S2. The expression or

activity of (I) is modulated to modulate a plant growth trait in a

flowering plant, of the family Brassicaceae, preferably in a plant that

is Arabidopsis, Brassica, Zea, Oryza, Triticum, Hordeum, Lolium, Sorghum,

Glycine, Medicago, Helianthus, Lactuca, Beta, Vitis, Solamum,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for determining a nucleotide sequence signature. The method comprises obtaining optical measurements with values indicating each nucleotide in a group of nucleotide positions, adjusting the values until the ratio of highest value in the set to next highest values in the set is at least a predetermined factor, and generating a base call for a position in the group based on results after the adjustment of values. The method is used for determining a signature of a nucleotide sequence, and for determining a nucleotide sequence of a polynucleotide from a series of optical measurements. The present sequence represents an adaptor, which is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining nucleotide sequence signature, by obtaining optical values for each nucleotide position in a group, adjusting them to get ratio of final highest values near predetermined factor, generating base call.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide polymorphisms SNPs. The present invention false of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP for the SNPs primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for genotyping nucleic acid samples, for e.g. to clasmity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. capammaglobulinaemia, diabeter inspidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease. Creategenesis imperfected and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cisease of which a component is or may be genetic such as autoimmune createses, including, rheumatoid arthritis, multiple sclerosis, ciflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and content and partains and partainty analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method of determining polynucleotide expression, which comprises hybridising digested cDNA to a capture probe coupled to a solid particle under stringent conditions, where the capture probe is specific for the target polynucleotide and the particle identifies the capture probe. The method is useful for expression profiling, where the presence and/or the amount of a target polynucleotide is simultaneously determined, for diagnosing a disease, condition, disorder, or predisposition associated with a change in expression patterns, in determining the developmental or physiological state of a cell or tissue, for detecting SNPs, which may be used to screen individuals for a genetic predisposition to a disease, condition, or disorder, and in marker assisted selection. The present sequence is a hybridisation tag described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Determining polynucleotide expression, useful for expressing profiling or detecting single nucleotide polymorphisms, comprises hybridizing digested cDNA to a capture probe coupled to a solid particle under stringent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in method comprises: (a) clones of the genomic libraries contained in multiwell plates independent of activities of the marker is dedected from the resultant sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal candinate cultures are amplified by using the above primer; (g) signals resultant cultures are amplified products; (h) the clones in the multiwell candinate of the amplified products; (h) the clones in the multiwell candinate of the maxed the maximum in the specified products; (h) the clones in the multiwell plates of the specified resultant cultures are amplified products; (h) the clones in the multiwell candinate of the maxed the multiwell plates of the plates of the maxed th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 are detected from the amplified products; (h) the clones in the multiwe plates are specified from the detected result; and (i) the clones are reconstituted as the positions on the chromosome and arrayed. The microarray is useful for gene analysis. ABL42957 to ABL45322 represent PCR primers for human chromosome 1p36-35 DNA, and ABL45323 to ABL45634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             e.g. c-myb,
                                                                                                                                                                                                                                  The present invention describes the cloning of a new gene sequence expressed and inhibited during hibernation of the top plumelet of a Camellia sinensis L.(O.) Kuntze tea tree. Also described is the identification, cloning and analysis of a primer terminal in the gene sequence expressed and inhibited during hibernation of the top plumelet of the tea tree. The present sequence represents a PCR primer which is used in an example from the present invention.
                                                                                       Cloning of a new gene sequence expressed and inhibited during winter dormancy of a tea tree top plumelet, comprises identification, cloning and analysis of a new primer in the gene sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
